(revised)

Threaded Studs

The Unified Numbering Systems for Metals and Alloys (UNS) provides a means of correlating many nationally used metal and alloy numbering systems currently administered by societies, trade associations, and those individual users and producers of metals and alloys.

Unified Numbering System for Metals and Alloys

SAE Handbook

The material is contained in more than 500 datasheet articles, each devoted exclusively to one particular alloy, a proven format first used in the complementary guide for irons and steels. For even more convenience, the datasheets are arranged by alloy groups: nickel, aluminum, copper, magnesium, titanium,

zinc and superalloys. The book provides very worthwhile and practical information in such areas as: compositions, trade names, common names, specifications (both U.S. and foreign), available products forms, typical applications, and properties (mechanical, fabricating, and selected others). This comprehensive resource also covers the more uncommon alloys by groups in the same datasheet format. Included are: refractory metals and alloys (molybdenum, tungsten, niobium, tantalum), beryllium copper alloys, cast and P/M titanium parts, P/M aluminum parts, lead and lead alloys, tin-rich alloys, and sintering copper-base materials (copper-tin, bronze, brass, nickel silvers).

Air Force Manual

These volumes cover the properties, processing, and applications of metals and nonmetallic engineering materials. They are designed to provide the authoritative information and data necessary for the appropriate selection of materials to meet critical design and performance criteria.

Electronic Engineers Master Catalog

Worldwide Guide to Equivalent Nonferrous Metals and Alloys

Proceedings of ASM International's 1993 Conference. In this volume, the papers describe real-world applications of putting composites to work. Once thought of as solutions in the search of problems, many of these composites are being mainstreamed into commercial applications. Nearly one-third of the book deals with physical and mechanical properties of ceramic matrix composites; other areas covered in detail are processing and characterization of intermetallic matrix composites and metal matrix composites; processing, fabrication and application of polymer matrix composites, fabrications of functionally gradient materials, and processing applications of carbon-carbon composites. Contributing authors hail from university, government and defense research facilities, as well as from aerospace companies across the country.

Aluminium-Werkstoff-Datenblätter

In den Aluminium-Werkstoff-Datenblättern werden die relevanten Daten für die gebräuchlichsten Aluminiumwerkstoffe in übersichtlicher Form zusammengefasst. Zweck der Datenblätter ist es, die Werkstoffauswahl unter technischen Aspekten zu erleichtern. Dazu gehören neben Angaben über mechanische Eigenschaften auch Hinweise über die Verwendbarkeit für genehmigungs- und überwachungspflichtige Erzeugnisse, über lieferbare Halbzeugarten und genormte Lieferzustände, über Korrosionsbeständigkeit, Eignung für bestimmte Oberflächenbehandlung,

Schweiß- oder Lötbarkeit, Spanbarkeit und Kaltumformbarkeit. Die 6. Auflage umfasst die Daten von rund 60 Aluminium-, Knet- und Gusswerkstoffen aus den entsprechenden europäischen Normen. Neu aufgenommen wurde eine Zusammenstellung der Zustandsbezeichnungen für Gussstücke und Halbzeug.
