BOOK DESCRIPTION: This Second Edition of The Discus Book has been written and produced with updates and additional information since the first edition, written in 1989, to accommodate "some" of the questionable technology changes, regarding this species since the first edition of the Discus Book, when the Author successfully bred Wild Discus (symphysodon) in captivity, the recording of such work and events transcribed to the said printed book. Alastair Agutter still remains one of a select few in the world today to accomplish such a feat, breeding wild symphysodon, and as a result of such endeavours by he, and other dedicated Aquarist colleagues, they managed to break a cycle and taboo that had lasted for more than 120 years, since the founding of the pastime we know as tropical fish keeping, after "The Great Exhibition" of 1851 and this being, to breed "The King of the Aquarium" in captivity. This second edition of the book is concise and accurate, based on proven methods and techniques, to deliver the above results. The Discus, King of the Aquarium is a highly evolved species of the Cichlidae (tooth carp) Family and will challenge any Aquarist, even tank bred species. This book will not produce any quick fixes, or silver bullets to keeping symphysodon, whom are a very highly evolved sensitive species. But will provide the secrets to successfully keeping the species, if the valuable information found in this book is followed to the letter. Natural Law teaches us to "evolve and refine" when studying quantum mechanics and natural branching, in other words stealth, efficiency and risk aversion. Such outcomes and results only ever come from following the covenant of Natural Law when one seeks "simplistic perfection" in all that we do! **CHAPTERS INSIDE THIS BOOK:** INTRODUCTION CHAPTER ONE A Little Background Discus and their Natural Environment and Origin of the Species CHAPTER TWO The Wild Discus Species CHAPTER THREE The Importance of the Correct Aquarium CHAPTER FOUR A Guide to Fish Food and Suitability for Discus CHAPTER FIVE Discus Prepared Super Foods and Recipes CHAPTER SIX Growing and Hatching Your Own Brine Shrimp CHAPTER SEVEN The Requirements for Discus Fish Filtration CHAPTER EIGHT The Genetics and Different Strains of Discus Fish CHAPTER NINE The Lighting and Electrical Needs CHAPTER TEN Collecting and Purchasing the Correct Fish CHAPTER ELEVEN The Correct Water Conditions and Techniques CHAPTER TWELVE The Spawning of Symphysodon CHAPTER THIRTEEN Rearing and Raising Healthy Discus to Adulthood CHAPTER FOURTEEN The Diseases and the Problems of the Species CHAPTER FIFTEEN Aquarists Essential Reference Tables CHAPTER SIXTEEN Author's Concluding Points

This is book one of a trilogy. This book identifies God's intent for the creation and how that applies today. The time frame for this book includes the time before "creation", the seven days of this creation, the initial sin of mankind and the initial consequences of that sin. Dr. Wood addresses the issue of evolution and how science and Scripture interface. Did dinosaurs exist or are they an elaborate hoax of science? Is the earth really six or seven thousand years old? How old is the universe? Are the cosmos and the earth the same age? When did men first walk the earth? Are we the first sentient persons to walk the earth? What are the spiritual realities placed in the earth during the seven days of this present creation? This book provides unique insight into creation, God's original intent and the awful consequences of sin.

As a young Norwegian Lutheran teenager in rural Wisconsin, Brocker lay awake one night worrying whether he believed in Jesus enough to get to heaven. This getting-to-heaven anxiety reflected an excessive focus on individual salvation and a loss of concern for the well-being of the Earth community. A faith journey that leaves Earth behind is misguided. Ever since those early teen years Brocker has been on a journey to come home to Earth. Coming Home to Earth makes the case that there is no salvation apart from Earth and that Earth care is at the core of our identity and mission as followers of Jesus. The ecological consequences of a loss of concern for the well-being of Earth have been devastating. Brocker is especially concerned to determine what will motivate followers of Jesus to make radical changes in our way of life so that we can participate in the healing of wounded Earth and all of its inhabitants, both human and nonhuman. We are far more likely to make needed sacrifices for our fellow creatures if we share God's delight in and affection for them, and cherish Earth as our home.

The moment I declared the last word, I felt a rush of wind from every direction, as though the power surge in my chest sucked energy from the entire Earth. The hurricane of energy imploded into me, and silence caused a still calm to fall onto the room. My skin tingled. Not like neuropathy, but like warm static electricity. "Whoa," I whispered. I expected an adventure when I left home for a new internship. A nice, easy, comfortable adventure that a sixteen-year-old burn victim like me could handle. That wasn't what happened. While I translated an ancient text for my new boss, a woman possessed by a ghost tried to kill me. Then an old wizard saved me by taking me to another planet. Saved? As if. Kidnapped is more like it--and that's just the beginning. According to him, I was the only wizard on my planet, and some prophecy destined me to save his planet, First Earth. The guy was crazy to think I could do anything like that. I could hardly walk more than ten minutes because of my neuropathy. Maybe I should just go home and forget about being a wizard. How am I supposed to save a whole other planet, with magic I don't know how to use and an army of demons led by an evil necromancer trying to murder me? Fate seriously messed up this time.

This book offers an ecology-based, wonder-filled initiation to the Universe and the Planet Earth. It examines the

ways in which humans are damaging the Earth and their own bodies and spirits. It also presents paradigms, values, and tools essential for both planetary and personal transformation.

"Never doubt that a small group of thoughtful, committed citizens can change the world; indeed, it's the only thing that ever has." Anthropologist Margaret Mead's famous quote may come to mind as you read this second volume in the Seeking Our Humanity series. In the first book, a small group of friends learned that the environmental crisis plaguing the Earth was not only grounded in our material pollution of land, seas and skies. A mysterious traveler from another plane of existence taught them that the Life Being Earth feels the anger, hatred, violence, and cruelty that people bear toward one another; they poison her life's very essence. Gently and firmly, he emphasized the urgency of the crisis and the gravity of the stakes: Earth will soon reach a tipping point that will make her uninhabitable for humankind. The mysterious guest invited them to join with beings throughout the universe to rescue the Earth, and taught them the simple steps that they could take daily to help her heal from this invisible, deadly toxicity. Called and empowered to be part of the solution, they joined forces to do so. In this installment, the commitment of these twelve dear friends to the mission deepens and expands. As they hone their skills, they confront the deep-seated doubts and fears that arise from so daunting a challenge. Readers find themselves embraced in the tender compassion that permeates their relationships, the deep listening and encouragement that they share with one another. Those who seek to heal the Earth, find healing themselves.

Rocks firmly anchored to the ground and rocks floating through space fascinate us. Jewelry, houses, and roads are just some of the ways we use what has been made from geologic processes to advance civilization. Whether scrambling over a rocky beach, or gazing at spectacular meteor showers, we can't get enough of geology! The Geology Book will teach you: What really carved the Grand Canyon. How thick the Earth's crust is. The varied features of the Earth's surface - from plains to peaks. How sedimentary deposition occurs through water, wind, and ice. Effects of erosion. Ways in which sediments become sedimentary rock. Fossilization and the age of the dinosaurs. The powerful effects of volcanic activity. Continental drift theory. Radioisotope and carbon dating. Geologic processes of the past. Our planet is a most suitable home. Its practical benefits are also enhanced by the sheer beauty of rolling hills, solitary plains, churning seas and rivers, and majestic mountains - all set in place by processes that are relevant to today's entire population of this spinning rock we call home.

The Earth System and its Co-evolution With Organisms

Teaching About and Exploring the Earth as Our Home

Some of the Old Ways Are Still Always The Best

Earth is, to our knowledge, the only life-bearing body in the Solar System. This extraordinary characteristic dates back almost 4 billion years. How to explain that Earth is teeming with organisms and that this has lasted for so long? What makes Earth different from its sister planets Mars and Venus? The habitability of a planet is its capacity to allow the emergence of organisms. What astronomical and geological conditions concurred to make Earth habitable 4 billion years ago, and how has it remained habitable since? What have been the respective roles of non-biological and biological characteristics in maintaining the habitability of Earth? This unique book answers the above questions by considering the roles of organisms and ecosystems in the Earth System, which is made of the non-living and living components of the planet. Organisms have progressively occupied all the habitats of the planet, diversifying into countless life forms and developing enormous biomasses over the past 3.6 billion years. In this way, organisms and ecosystems "took over" the Earth System, and thus became major agents in its regulation and global evolution. There was co-evolution of the different components of the Earth System, leading to a number of feedback mechanisms that regulated long-term Earth conditions. For millennia, and especially since the Industrial Revolution nearly 300 years ago, humans have gradually transformed the Earth System. Technological developments combined with the large increase in human population have led, in recent decades, to major changes in the Earth's climate, soils, biodiversity and quality of air and water. After some successes in the 20th century at preventing internationally environmental disasters, human societies are now facing major challenges arising from climate change. Some of these challenges are short-term and others concern the thousand-year evolution of the Earth's climate. Humans should become the stewards of Earth.

A description of Earth, the third planet from the sun, which includes information on its origins, composition, and unique characteristics.

In THE GAMBIT WITH PERFECTION, Cornelius Selendia continues his journey to Blackeye Cavern, Supreme Scientist Damosel Rhea makes progress on Project Silkscape, and the consequences of failure during the last Jubilee confront the Barão Strike Team. Captain Broden Barão, Striker Nero Silvana, and Strategist Verena Iglehart have been recalled to the Huelel Facility for a commonwealth mission to the Vigna system. Will the Barão Strike Team succeed in the mission? Will Cornelius make it to the Cavern before the commonwealth's agents recapture him? Will Damy revive the prehistoric life vital to her survival in the commonwealth? As the season shifts from spring to summer on the Earth's surface, civilizations collide inside the planets Earth and Vigna, changing the world in unexpected ways.

Over a very short period, only a few hundred years, our understanding of the cosmos, our planet Earth, the evolution of life on it, and the beginnings of our very own human endeavor have radically changed. These revolutions in science and technology have dramatically altered our societies in many ways. For quite some time it seemed as if our planets resources were unlimited. Today we know that this is not the case. Human civilizations are shaping our planets future in ways that have profound consequences for all other life on Earth as well as for us. We need to reflect broadly on what defines our human condition if we wish our societies to be successful in navigating a future that cannot be just ours but must include the broad diversity of life on Earth without which humankind will not survive. This book tells the story of how we discovered the universe, how we learned about our planet and the life evolving on it, how humanity emerged from pre-history, and what some of the future of our civilizations could hold.

'A brilliant synthesis of ecology and economics that provides a sure guide to a sustainable future. It is a must for all environmentalists and economists.' Charles Birch

'Written by an impressive list of experts across a number of disciplines, this readable

text provides not only analysis but vigorous criticism-and answers.' Robyn Williams 'This book is such a useful guide to responsible decision-making that it should be supplied in bulk to senior government officials and managers in the private sector.' Ian Lowe 'This is a fine contribution to ecological economics coming from Australia, and of interest worldwide.' Herman E Daly Human well-being is wholly dependent upon the continued good health of the Earth's ecosystems. Human behaviour as it interacts with the biophysical environment is enormously complex, as governments (and individuals) who must make decisions about resource use are becoming increasingly aware. Human Ecology, Human Economy provides the basic concepts and tools for understanding how to analyse that interaction. The book is designed to be used as a text for undergraduate and graduate students in environmental studies, human and social ecology, ecological economics, futures studies, and science and technology studies. It is also intended for interested members of the public and for policy-makers working on environmental issues, especially where these intersect with economic policy. Human Ecology, Human Economy not only covers the basic concepts, but also moves to some of the frontiers of thinking in several case studies. It uses a problem and solution oriented approach which crosses disciplinary boundaries, drawing together elements from biology, economics, philosophy and political science. Professor Mark Diesendorf is Director of the Institute for Sustainable Futures at the University of Technology, Sydney and Vice President of the Sustainable Energy Industries Council of Australia. Among the books he has edited are The Magic Bullet and Energy And People. Dr Clive Hamilton is Executive Director of the Australia Institute, Canberra and teaches in the Public Policy Program at the Australian National University. His books include Capitalist Industrialisation In Korea, The Mystic Economist and The Economic Dynamics Of Australian Industry.

Rice and Williamson have done a remarkable job of sifting through five centuries of the recorded prayers by Reformed Christians to produce this collection. --The Presbyterian Outlook.

The earth, our home, is in crisis. There are two sides to this crisis—our global economy, and its effect on the ecology of our home planet. Despite conventional thinking that typical monetary and fiscal manipulations will put us back on the path of economic growth, the reality is not that simple. Meanwhile, the natural environment is sending unmistakable warnings. Glaciers are melting; oceans are becoming dangerously acidic; species and their ecological services are becoming extinct; and weather patterns are becoming increasingly severe and unpredictable each year. The stress on resource systems of all kinds threatens to shrink the carrying capacity of the planet, even as we call upon it for increased contributions to support a burgeoning human population. Co-written by an ecologist and an economist, *Economics and Ecology: United for a Sustainable World* counsels the replacement of symptomatic thinking with a systemic worldview that treats the environment and the economy as an ecosystemic unit. The first part of the book establishes the methodological and biophysical principles needed to develop the concept of socioeconomic sustainability. The second part of the book examines the misuse of economics in the service of what increasingly appears to be a ruinous pursuit of material wealth and expansion. The third part offers advice on reconciling economics and ecology by proposing an economics in which the principles employed are aligned with the biophysical principles of ecology. This timely volume puts forth a sustainable worldview based on systemic thinking, with the emphasis more on what and how people think than on what they do. A unique reference for professionals and laypersons alike, it can also serve as a supplementary classroom text for students of economics, ecology, biology, and environmental science.

This new text is presented in a style aimed at drawing students into close engagement with the subject matter, providing a solid education and fostering a sense of wonder and responsibility for God's amazing world. This text is perfect for middle school-aged students. It includes all the popular characteristics of Novare textbooks: smaller profile, vibrant, original, and relevant graphics, lucid conversational prose, and an approach that connects students with real-world science as stewards of God's creation. And of course, Novare's guiding principles of Mastery, Integration, and Kingdom perspective are woven throughout this text. Mastery learning is felt in the way key concepts, definitions, and skills are repeatedly brought up so that students rehearse and reenounter materials with a view toward more thorough retention of course content. We integrate relevant subjects such as mathematics, history, language skills, measurement, and more to both enhance the reading and demonstrate the connections that exist between all subjects. And Novare's Kingdom Perspective is evident in the attribution of the marvels of creation to God's creative power. Author Kevin Nelstead regularly draws the reader to appreciate the intricacy and excellence of God's works, tying in scripture where appropriate. Earth Science should be about much more than learning about rocks and mountains and the seasons. Think about how huge God's mandate to humans is that we are to steward and exhibit vice regency over creation! The best Christian curriculum will bring students into the wonder of God's astounding creation and foster the mind of a gracious and caring steward. Within the context of the fascinating study of landforms, minerals and planetary phenomena, many other timely and important topics are covered including conservation of natural resources, climate change, pollution, environmental justice, and the current scientific consensus concerning geologic history.

From a leading planetary scientist and an award-winning science writer, a propulsive account of the developments and initiatives that have transformed the dream of space colonization into something that may well be achievable. We are at the cusp of a golden age in space science, as increasingly more entrepreneurs—Elon Musk, Richard Branson, Jeff Bezos—are seduced by the commercial potential of human access to space. But *Beyond Earth* does not offer another wide-eyed technology fantasy: instead, it is grounded not only in the human capacity for invention and the appeal of adventure but also in the bureaucratic, political, and scientific realities that present obstacles to space travel—realities that have hampered NASA's efforts ever since the Challenger disaster. In *Beyond Earth*, Charles Wohlforth and Amanda R. Hendrix offer groundbreaking research and argue persuasively that not Mars, but Titan—a moon of Saturn with a nitrogen atmosphere, a weather cycle, and an inexhaustible supply of cheap energy, where we will even be able to fly like birds in the minimal gravitational field—offers the most realistic and thrilling prospect of life without support from Earth. (With 8 pages of color illustrations)

"An audacious and concrete proposal...*Half-Earth* completes the 86-year-old Wilson's valedictory trilogy on the human animal and our place on the planet." —Jedediah Purdy, *New Republic* In his most urgent book to date, Pulitzer Prize-winning author and world-renowned biologist Edward O. Wilson states that in order to stave off the mass extinction of species, including our own, we must move swiftly to preserve the biodiversity of our planet. In this "visionary blueprint for saving the planet" (Stephen Greenblatt), *Half-Earth* argues that the situation facing us is too large to be solved piecemeal and proposes a solution commensurate with the magnitude of the problem: dedicate fully half the surface of the Earth to nature. Identifying actual regions of the planet that can still be reclaimed—such as the California redwood forest, the Amazon River basin, and grasslands of the Serengeti, among others—Wilson puts aside the prevailing pessimism of our times and "speaks with a humane eloquence which calls to us all" (Oliver Sacks).
