Implant dentistry is now an integral part of everyday dental practice; however, most dentists receive their education in implant dentistry after graduation, with little emphasis on the identification of the complexity and risks of treatment. Since 2003 the International Team for Implantology (ITI) has recommended the SAC Classification to categorize implant treatment procedures into three levels of difficulty-straightforward, advanced, and complex. In 2007 the ITI organized a conference to standardize the application of the SAC classification, the conclusions of which are presented in this volume. This invaluable resource will help clinicians identify treatment complexity and risk before treating a patient, thereby improving the predictability and success of their outcomes.

During their service life, most biomaterials and medical implants are vulnerable to tribological damage. In addition, the environments in which they are placed are often corrosive. The combination of tribology, corrosion and the biological environment has been named 'bio-tribocorrosion'. Understanding this complex phenomenon is critical to improving the design and service life of medical implants. This important book reviews recent key research in this area. After an introduction to the topography of bio-tribocorrosion, Part one discusses different types of tribocorrosion including fatigue-corrosion, fretting-corrosion, wear-corrosion and abrasion-corrosion. The book also discusses the prediction of wear in medical devices. This clinically oriented text provides the essential information needed to understand periodontal diseases and deliver effective treatment. Written in user-friendly style, it explains the biology of the periodontium in health and disease, gives detailed instructions on patient examination, and discusses various local and systemic risk factors. Actual case scenarios illustrate how to interpret clinical evidence, make a diagnosis and develop a treatment plan for the most common forms of disease. Also covered are implant therapy and adjunct treatment procedures that may be needed to enhance periodontal health. This exceptional new book is designed as a self-instruction guide to the diagnosis, management, and prevention of surgery-related complications in implant dentistry. It functions in two ways: First, it is a valuable resource for the implant surgeon seeking practical and succinct information about how to manage a complication in an emergency setting; and second, it can be read from cover to cover as a primer on implant surgery, from the initial consultation and treatment planning through the restorative phase of treatment. Besides addressing pre-, intra-, and postoperative implant surgery complications, the book also includes a comprehensive treatment-planning protocol that allows for the early detection of potential surgical complications and how to avoid them. Early detection of complications that are amenable to rescue therapies may reverse the fate of a failing implant or a bone-grafting procedure. Invaluable for the novice and experienced implant surgeon alike.

Periodontology explores the molecular status in periodontal disease. Optical devices in the diagnosis and management of the disease are also discussed. The book addresses the role of the oral healthcare provider in interprofessional communication in the systemic management of autoimmune bullous disease-associated conditions. A study involving chemically modified tetracyclines and host modulation with nonsurgical and surgical periodontal therapy, including postoperative pain management, is presented here. Therapeutic strategies of stem cell application in bone tissue engineering and the potential of platelet-rich fibrin-sourced growth factors in periodontal procedures to enhance wound healing and regeneration are also proposed. Supportive implant maintenance and regenerative processes are explored. Management of the endoperiodontal lesion is also discussed (note: the recent periodontal classification has not been referenced here). The book explores the best transdisciplinary practices for the management of special healthcare needs patients.

A thorough understanding of occlusion - although absolutely crucial for safe clinical practice - affords a particular challenge for many dental students and practitioners. Particularly relevant to the practise of restorative dentistry and prosthodontics, this subject is also highly applicable to orthodontics and maxillofacial surgery.
