*Specific ion effects are important in numerous fields of science and technology. They have been discussed for over 100 years, ever since the pioneering work done by Franz Hofmeister and his group in Prague. Over the last decades, hundreds of examples have been published and periodically explanations have been proposed. However, it is only recently that a profound understanding of the basic*

This book summarizes the main new ideas that have come up in the last ten years. In this book, the efforts of theoreticians are substantially supported by the experimental results stemming from new and exciting techniques. Both the new theoretical concepts and the experimental landmarks are collected and critically discussed by eminent scientists and well-known specialists in this field. Beyond*

thiophene (C<sub>4</sub>H<sub>2</sub>S)<sub>x</sub>' etc., which are insulators in their pristine state, can be brought to the metallic state after "doping" with chemical species which can be either electron donors or acceptors. This doping process involves a charge transfer between the dopant molecule and the polymer chain which are then supposed to be spatially close to each other. It follows that the mechanism of doping must be considered as an actual intercalation process, which will greatly affect the structural characteristics of the starting

material, as well as its morphology, as has been observed during the 2 intercalation of graphite and layered compounds . In parallel with these modifications, the band structure of the system changes yielding a new set of electronic properties. It is evident therefore that the structural and electronic properties are intimately related, and must be studied simultaneously in the same system to give reliable information. A great number of studies have been devoted to the

structural and electronic properties of conjugated polymers after a chemical or electrochemical doping process. Most of these concern the properties of the system for a given dopant concentration. With this approach a universal picture of the polymer/dopant system is very difficult to obtain, as a comparison between different experiments is very hazardous. On the other hand, only a small number of measurements have been performed during the continuous electrochemical doping of various polymers.

"How and why does television news interviewing differ from country to country? In this comparative study of the news in the UK, the US, Israel and West Germany, Cohen shows that -- while the structure and content of TV news is very similar -- interviews reflect political, social and cultural factors. Cohen examines news interviewing from theoretical, empirical and practical perspectives. Through a comprehensive literature review, content analysis and personal interviews with reporters, he demonstrates that news interviews should be viewed as social constructs"--Publisher description.
