Since the 1970s, various sociological approaches have tried to understand and conceptualize "the global," yet few of them have systematically addressed the full spectrum of social relationships. Prominent exponents of the global approach - such as world systems analysis - instead have focused on particular domains such as politics or the economy. Under the label of "world society," however, some authors have suggested alternatives to the

predominant equivocation of society and the nation-state. The contributions to this volume share that objective and take their point of departure from the two most ambitious projects of a theory of world society: world polity research and systems theory, mapping out the common ground and assessing their potential to inform empirical analyses of globalization.

**Principles and Practice of Maternal
Critical Care**

The nineteenth edition of Modern Microeconomics continues to provide a detailed understanding of the foundations of microeconomics. While it provides a solid foundation for economic analysis, it also lucidly explains the mathematical derivations of various microeconomic concepts. This textbook would be extremely useful for the students of economics.

This text uses the theory of the firm to integrate and link economic theory (microeconomics and macroeconomics), decision sciences

(mathematical economics and econometrics), and the functional areas of business (accounting, finance, marketing, personnel or human resource management, and production) and shows how all of these topics are crucial components of managerial decision making. The text is divided into five parts-Part I examines the nature and scope of managerial economics, Part II analyses demand, Part III presents the theory and measurement. It covers the full range of optimization techniques used in managerial decision making. The book offers extensive end-chapter material in the form of the summary, discussion questions, problems, chapter appendixes along with appendix problems, supplementary readings, and Internet site addresses. This seventh edition includes new sections, new case studies, some of which are India based, and five new longer Indian integrated case studies. In addition, the existing case studies,

supplementary readings, and Internet site addresses have been revised.

"This book contains a collection of the most recent insights regarding maternal morbidity and mortality and optimization of the care processes during acute critical illness. The volume represents a practical resource to be used in real-time by medical practitioners faced with a woman who is critically ill during pregnancy and the peripartum period. By providing concise tools for disease identifiers and management flow-charts, the Editors aimed to increase awareness and improve processes of care for this population. Many care paradigms for obstetric patients are currently unstandardized, unfocused and often do not follow a pre-determined path. Each chapter will provide the practitioner with updated information on how to identify specific critical conditions and how to manage them

once they have been identified, to enhance recognition and readiness. This book should be used as a resource to improve the quality of care administered to obstetric patients, to reduce fragmented care processes and to improve interdisciplinary coordination and communication, with the overall aim of decreasing maternal morbidity and mortality. Therefore, this book represents an invaluable guide to specialists in critical care, anesthesia and obstetrics as well as to intensive care nurses and midwives."

to cover the whole syllabus and important topics of the subject. This book has been developed with an emphasis on quality and contemporary content. KEY FEATURES • Content has been developed according to the syllabus requirements • The units are written in simple language • Numerous illustrations, examples and case studies for better understanding of concepts • Chapter end questions for practice Completely devoted to application of models to optimize the use of limited water and nutrients in various climates, this collection will inspire confidence in the capacity of modeling to tackle the biggest threats to secure agriculture. To

obtain the most producti on from available water while maintaining natural resources, we need whole system-based quanti tati ve knowledge and tools to help select appropriate crops and manage water and associated inputs on a site-specifi c basis under changing climate. Site-specifi c experimental results are available for limited locati ons, limited periods of ti me, and limited management opti ons. Well-tested process models of cropping systems can extend fi eld research results to long-term weather conditi ons, as well as other climates and soils, allowing us to explore new management opti ons. The case studies in this volume are

promising examples of these kinds of solutions. This book presents a systems thinking approach in relation to the Sustainable Development Goals for sustainable national development in vulnerable countries. Systems thinking is a process for understanding the interrelationships among the key components of a system; this book illustrates sustainable development as a system. Key environmental issues are discussed showing their relationship to socioeconomic aspects of development, in the light of increased climate threats and environmental disasters.
