In these sixteen essays, written between 1939 and 1965, George Devereux argues that the understanding of all human behavior requires the application of both psychological and sociocultural methods of explanation. This unique approach, which differentiates sanity and insanity from social adjustment and maladjustment, provides a rigorous foundation for a general theory of psychoanalytic ethnopsychiatry. George Devereux, a psychoanalyst and anthropologist, discusses crime, sexual delinquency, dreams in non-Western cultures, and cannibalistic drives of parents. He frequently cites case material from

his extensive field work with the Mahave Indians of Arizona and the Sedang Moi of Vietnam and from his clinical work with non-Western patients.

Presents the findings of new research into the problem of students dropping-out from their courses, and provides information that will help institutions understand and address the problem. The book clarifies definitions of non-completion, looks at what influences students to leave early, assesses the implications for the institution's performance and the costs to the public purse. The analysis is illustrated by examples of student experience, and highlights courses of action that may help to reduce the problem.

without knowing its inner meaning. T'ai Chi Classics presents the inner meaning and techniques of T'ai Chi movements through translations of three core classics of T'ai Chi, often considered the "T'ai Chi Bible." The texts are introduced by three chapters explaining how to increase inner energy (ch'i), transform it into inner power (jing), and project this inner power outward to repel an opponent without physical contact. Master Liao also provides a description of the entire sequence of T'ai Chi movements, illustrated by his own line drawings.

This new edition of *The
Treatment of Pain with Chinese
Herbs and Acupuncture* gives a
thorough and analytical review
of the diagnosis and treatment
options for pain, using
acupuncture with Chinese
herbal medicine. Based on the
clinical experience of the
author and supported by that of

acupuncturists in Chinese universities, it offers a comprehensive and detailed set of treatments for a wide variety of pain symptoms and conditions, and includes detailed modifications of the treatments, to aid clinical practice. Although pain syndromes are often complicated, involving both psychological and physical difficulties, resulting in sometimes hesitation in deciding a correct treatment, there are still some short-cut ways to achieve a successful result. Therefore, the essential intentions of the authors are

very clear: To demonstrate the practitioners how to differentiate the clinical situations and how to establish the corresponding treatments. To illustrate how to apply Chinese herbs logically and how to consist an acupuncture prescription reasonably and effectively. Features - Thorough exploration of the aetiologies and pathologies for pain in the context of Traditional Chinese Medicine - Clear discussion of the principles of treatment, acupuncture point selection and combination - Detailed explanation of herbal and acupuncture treatments for

common and complex pain conditions - Deals comprehensively with the commonest clinical presenting symptoms - Provides treatment plans and modifications to these plans, offering more options for the practitioner - Includes detailed and useful case histories New to this edition: New chapter on treatment of pain in children Separate sections for the gynecologic conditions Includes Western-named conditions Red Flags for practitioners to indicate situations which are potentially life-threatening or dangerous Suggested

treatments now include acupuncture as well as herbal treatments Following on from each treatment a prognosis is now provided

Up-to-date, authoritative and comprehensive, Heart Failure, 4th Edition, provides the clinically relevant information you need to effectively manage and treat patients with this complex cardiovascular problem. This fully revised companion to Braunwald's Heart Disease helps you make the most of new drug therapies such as angiotensin receptor neprilysin inhibitors (ARNIs), recently improved implantable

devices, and innovative patient management strategies. Led by internationally recognized heart failure experts Dr. G. Michael Felker and Dr. Douglas Mann, this outstanding reference gives health care providers the knowledge to improve clinical outcomes in heart failure patients. Focuses on a clinical approach to treating heart failure, resulting from a broad variety of cardiovascular problems. Covers the most recent guidelines and protocols, including significant new updates to ACC, AHA, and HFSA guidelines. Covers key topics such as biomarkers and

precision medicine in heart failure and new data on angiotensin receptor neprilysin inhibitors (ARNIs). Contains four new chapters: Natriuretic Peptides in Heart Failure; Amyloidosis as a Cause of Heart Failure; HIV and Heart Failure; and Neuromodulation in Heart Failure. Covers the pathophysiological basis for the development and progression of heart failure. Serves as a definitive resource to prepare for the ABIM's Heart Failure board exam. 2016 British Medical Association Award: First Prize, Cardiology (3rd Edition).

Grigorova, a chemist, homeopath, and pharmacist, summarizes 11 years of her work as a naturopathic practitioner in Africa where she explored the action of a number of homeopathic remedies on different pathogens while testing patients with the Voll method.

The AGRONOMY AND HEALTH theme encompasses many soil-plant-animal relationships that influence "total health" - reproduction, longevity, vigor, mental capacity, and happiness of people everywhere. The high availabilities of nutritious foods is an absolute necessity. We

sometimes forget that plant life developed before animal life.

Plants alone utilize radiant energy to fix simple carbohydrates that with other materials are subsequently metabolized into organic compounds to supply energy and nutritional needs for all animal life. Animal products improve the nutritional value, palatability, and pleasure of eating.

The inflammasome was first described in 2002 as a molecular complex activating proinflammatory caspases and therefore regulating the maturation and biological activities of cytokines such as IL-1 β and IL-18. This finding was substantiated by the identification of several mutations in the *CIAS1* gene, encoding the human NLRP3 protein, responsible for several autoinflammatory disorders such as the Muckle Wells syndrome. Since, the interest for this complex

has constantly increased and several inflammasome complexes with different specificities have been described. These inflammasomes sense a wide variety of pathogens and danger signals and are key players in the inflammatory response. With the contributions of leading international experts in the field, this book provides an extensive overview of the current knowledge of inflammasome biology and their role in health and disease. Comprehensive, expert clinical guidance enables you to recognize the clinical manifestations of stroke, use the latest laboratory and imaging studies to arrive at a diagnosis, and generate an effective medical and surgical treatment plan. Abundant full-color CT images and pathology slides help you make efficient and accurate diagnoses. Data from late-breaking endovascular trials equips you with recent findings. Includes comprehensive coverage of advances in molecular biology of cell death; risk factors and

prevention; advances in diagnostics and stroke imaging; and therapeutic options, including a thorough review of thrombolytic agents and emerging data for endovascular therapy. Features brand-new chapters on Intracellular Signaling: Mediators and Protective Responses; The Neurovascular Unit and Responses to Ischemia; Mechanisms of Cerebral Hemorrhage; Stroke Related to Surgery and Other Procedures; Cryptogenic Stroke; and Interventions to Improve Recovery after Stroke. Highlights new information on genetic risk factors; primary prevention of stroke; infectious diseases and

stroke; recovery interventions such as robotics, brain stimulation, and telerehabilitation; and trial design. Details advances in diagnostic tests, such as ultrasound, computed tomography (including CT angiography and CT perfusion), MRI (including MR perfusion techniques), and angiography. Includes extracted and highlighted evidence levels. Expert Consult eBook version included with print purchase. This enhanced eBook experience allows you to search all of the text, figures, and references on a variety of devices. The content can also be downloaded to tablets and smart phones for offline use. *The purpose of the first four
volumes of the Handbook of
Genetics is to bring together
collections of relatively short,
authoritative essays or annotated
compilations of data on topics of
significance to geneticists. Many of
the essays will deal with various
aspects of the biology of certain
species or species groups selected
because they are favorite subjects
for genetic investigation in nature
or the laboratory. Often there will
be an encyclopedic amount of*

information available on such species, with new papers appearing daily. Most of these will be written for specialists in a jargon that is bewildering to a novice, and sometimes even to a veteran geneticist working with evolutionarily distant organisms. For such readers what is needed is a written introduction to the morphology, life cycle, reproductive behavior, and culture methods for the species in question. What are its particular advantages (and disadvantages) for genetic study, and what have we learned from it? Where are the classic papers, the key bibliographies, and how does one get stocks of wild type or

mutant strains? Lists giving the symbolism and descriptions for selected mutants that have been retained and are thus available for future studies are provided whenever possible. Genetic and cytological maps, mitotic karyotypes, and haploid DNA values are also included when available. Volume 4 deals with certain vertebrate species that have been studied in considerable detail from the standpoint of genetics or molecular cytogenetics. Such data are available for only a relatively few vertebrates.

This treatise had its origins in the authors' strong opinion that the discovery of new drugs, especially

of innovative therapeutic agents, really does not happen as a spontaneous sequel to investigative research, no matter how penetrating such research may be. Rather, it seemed to us that the discovery of innovative therapeutic agents was a very active process, existing in and of itself, and demanding full attention-it was not simply a passive, dependent by-product of investigative research. And yet, many researchers some close confreres of the authors, others more distant-believed otherwise. We felt that their view reflected unrealistic thinking and that reality probably lay closer to what Beyer'' maintained: We are

taught to believe that if we can understand a disease it should be easy enough to figure out, say, the molecular configuration of a definitive receptor mechanism somewhere along the line and to design a specific drug And so we start out to understand the disease but never get around to doing much about therapy. The authors very soon realized that there was essentially no quantitative information available on just where and how innovative therapeutic agents were discovered. There were only anecdotal accounts, and these were able to be selected and presented in ways that could be used to defend any point of view.

This selection of reviews gives an up-to-date picture of memory research. Great progress has been made in identifying the memory trace at the molecular and cellular level and individual reviews address the major mechanisms by which changes in synaptic strength can persist. Exciting research at the systems level is also reviewed including the growing importance of changes in inhibitory interneurons and how they play a role in memory formation. Finally, reviews present cognitive and neurobiological models of human memory that explain, characterize and organize the act of memory within a coherent framework.

Barbara Browning follows the trail of "infectious rhythm" from the ecstatic percussion of a Brazilian carnival group to the eerily silent video image of the LAPD beating a man like a drum. Throughout, she identifies the metaphoric strain of contagion which both celebrates the diasporic spread of African culture, and serves as the justification for its brutal repression. The essays in this book examine both the vital and violent ways in which recent associations have been made between the AIDS pandemic and

African diasporic cultural practices, including religious worship, music, dance, sculpture, painting, orature, literature and film. While pointing to the lengthy and complex history of the metaphor of African contagion, Browning argues that in its politicized, life-affirming embodiment, the figure might actually teach us to respond to epidemia humanely.

This newest volume of *Advances in Neurobiology* deals with the Neurochemistry of disease, with chapters covering both human diseases and animal “model” diseases.

An important contribution to medical anthropology, this work defines the principal causes of illness that are reported throughout the world, distinguishing those involving natural causation from the more widely prevalent hypotheses advancing supernatural explanations.

Neuroendocrinology is a

discipline which originated about 50 years ago as a branch of Endocrinology and that is now strictly linked to neuroscience. Volumes 181 and 182 of Progress in Brain Research provide a rapid view of the major points presently discussed at biological and clinical levels. The chapters have been written by top scientists who are directly involved in basic or clinical research and who use the most sophisticated biotechnological techniques. The volumes cover of the role of genetics in many endocrine-related events,

like neuroendocrinological diseases and endocrine dependent cancers (prostate, breast, etc.). Interesting information is also provided on possible treatments of neurodegenerative brain diseases (e.g., Alzheimer and similar syndromes). . The best researchers in the field provide their conclusions in the context of the latest experimental results . Chapters are extensively referenced to provide readers with a comprehensive list of resources on the topics

covered . Of great value for researchers and experts, but also for students as a background reference This book takes a close look at the ways that five sign languages borrow elements from the surrounding, dominant spoken language community where each is situated. It offers careful analyses of semantic, morphosyntactic, and phonological adaption of forms taken from a source language (in this case a spoken language) to a recipient signed language. In addition, the

contributions contained in the volume examine the social attitudes and cultural values that play a role in this linguistic process. Since the cultural identity of Deaf communities is manifested most strongly in their sign languages, this topic is of interest for cultural and linguistic reasons. Linguists interested in phonology, morphology, word formation, bilingualism, and linguistic anthropology will find this an interesting set of cases of language contact. Interpreters and sign language teachers will also

find a wealth of interesting facts about the sign languages of these diverse Deaf communities.

Data Analysis and Visualization in Genomics and Proteomics is the first book addressing integrative data analysis and visualization in

this field. It addresses important techniques for the interpretation of data originating from multiple sources, encoded in different formats or protocols, and processed by multiple systems. One of the first systematic overviews of the problem of biological data integration using computational approaches This book provides scientists and students with the basis for the development and application of integrative computational methods to analyse biological data on a systemic scale Places emphasis on the processing of multiple data and knowledge resources, and the combination of different models and systems

With authoritative coverage of everything from recent discoveries in the field of vascular biology to recent clinical trials and evidence-based treatment strategies, Vascular Medicine, 3rd Edition, is your go-to resource for improving your patients' cardiovascular health. Part of the Braunwald family of renowned cardiology references, this updated volume integrates a contemporary understanding of vascular biology with a thorough review of clinical vascular diseases, making it an ideal reference for vascular medicine specialists, general cardiologists, interventional cardiologists, vascular surgeons, and

interventional radiologists. Incorporates technologic advances in vascular imaging - including ultrasound, MRI, CTA, and catheter-based angiography - along with more than 230 new figures, providing an up-to-date and complete view of the vascular system and vascular diseases. Covers novel antithrombotic therapies for peripheral artery disease and venous thromboembolism, advances in endovascular interventions for aortic aneurysms, and today's best surgical treatments for vascular diseases. Includes seven new chapters: Pathobiology of Aortic Aneurysms; Pathobiology and Assessment of Cardiovascular

Fibrosis; Large Vessel Vasculitis; Medium and Small Vessel Vasculitis; Epidemiology and Prognosis of Venous Thromboembolic Disease; Fibromuscular Dysplasia; and Dermatologic Manifestations of Vascular Disease. Discusses methods for aggressive patient management and disease prevention to ensure minimal risk of further cardiovascular problems. Keeps you current with ACC/AHA and ECC guidelines and the best ways to implement them in clinical practice. This volume examines some of the ways in which dictionary use has been studied, considers the problems encountered by

researchers in this field, and presents a series of experiments which explore fundamental questions concerning the use of dictionaries by learners of English as a foreign language. - Are dictionaries helpful in examinations? Does defining style affect consultation success? Do dictionaries benefit some kinds of learners more than others? How useful are illustrative examples? The author concludes with an analysis of current trends in the design of dictionaries for learners of English, and considers the possible impact of new electronic formats on dictionary use. Get the core knowledge in pain medicine you need from one of the

most trusted resources in the field. The new fourth edition guides you through every aspect of pain medicine with concise descriptions of evaluation, diagnosis of pain syndromes, rationales for management, treatment modalities, and much more. From commonly seen pain syndromes, including headaches, trunk pain, orofacial pain, back pain, and extremity pain...through specific pain management challenges such as postoperative pain, pain due to cancer, phantom pain, and pain in the management of AIDS patients...this popular text will equip you with the know-how you need to effectively manage even your most challenging cases.

A practical, multidisciplinary approach to pain management makes key concepts and techniques easier to apply to everyday practice. Expert contributors provide the latest knowledge on all aspects of pain management, from general principles through to specific management techniques. Detailed discussions of the latest concepts and treatment plans help you provide the best possible outcomes for all your patients. This monograph explores the unity of the modern concepts of magic and science in Egyptian medicine.

The concept of 'person-centredness' has become

established in approaches to the delivery of healthcare, particularly with nursing, and is embedded in many international healthcare policy frameworks and strategic plans. This book explores person-centred nursing using a framework that has been derived from research and practice. Person-centred Nursing is a theoretically rigorous and practically applied text that aims to increase nurses' understanding of the principles and practices of person-centred nursing in a multiprofessional context. It advances new understandings of person-centred nursing concepts and theories through the

presentation of an inductively derived and tested framework for person-centred nursing. In addition it explores a variety of strategies for developing person-centred nursing and presents case examples of the concept in action. This is a practical resource for all nurses who want to develop person-centred ways of working.

A comprehensive review of what is known not only about the cause and treatment of atypical parksonian disorders, but also the issues that clinicians, researchers, patients, and caregivers face in dealing with them. The authors cover the basic science (history,

epidemiology, genetics, pathology, nosology, computer modeling, and animal models), detailed clinical and laboratory assessments, and available diagnostic tools, including neuropsychiatric, neurologic, neuropsychologic, speech, electrophysiologic, and imaging evaluations. Current and future therapeutic approaches are also detailed, along with extensive discussions about future research directions.
