The history of electronics can be traced back to 1874

when Irish scientist George Johnstone Stoney

(1826-1911) suggested that electricity must be "built" out

of tiny electrical charges. Twenty years later, he coined

the name "electron". Interest in electronics gradually

increased over the decades following Stoney's discovery.

In 1947 the transistor was invented by William Shockley, John Bardeen and Walter Brattain at Bell Labs, which revolutionized the computer industry by replacing fragile, power hungry valves with much smaller and reliable devices. During the 1950s and 60s, computers became more powerful and smaller, eventually leading to the introduction of the home personal computer (PC) in the 1970s. Today, electronic devices are all around us ... computers, cell (mobile) phones, televisions, calculators, hearing aids, and cars are just a few examples of devices that form part of everyday life in the 21st century and which make use of electronics. You will also learn how to combine such components to build electronics circuits. Although there is a logical flow in the way that information is presented, you can pretty much jump around from chapter to chapter as it suits you, picking out the material that is of most interest. The book is split into two parts - the first introduces the subject of electronics,
