Purpose of study: The need for enrichment programs that exposes a diverse population of youth to health careers, is key to meeting national goals in helping eliminate health disparities. In this report, we describe the effectiveness of a unique and highly interactive enrichment program in garnering the interest of a diverse population of middle school students towards a career in the health field. **Methods:** To give youth a glimpse of life in medical school, we designed a structured program during the academic calendar that mimics the medical school's interactive curriculum. **The workshops included but were not limited to lab practical's on human brain anatomy and sheep heart dissection, nutrition lectures, clinical skills sessions, bedside ultrasound, and robotics. The students were accepted through an application process. Students were sought out by their teachers and by interest in the medical field. We encouraged participation of those underrepresented in medicine by collaborating with schools in underserved areas. A feedback survey was distributed at the end of the program to measure the effectiveness of the program in helping them with their future goals and professional development as well as the effectiveness of the workshops. A 5-point scale was used, 1=least effective or 5 most effective. Summary of results : During the 2014-2015 academic year, 95 middle school students participated in the program and 57% were underrepresented in medicine. Of 95, 85 (89%) completed evaluations were collected. The average rating of the workshops ranged from 3.3 to 5.0, with anatomy lab and the medical school tour each having the highest rating of 4.7. As a result of this program, students gave an average rating of 4.4 out of 5 regarding their motivation to pursue a career in medicine, and a rating of 4.35 for interest in serving the underserved. Conclusions : The Hippocrates Circle of Kaiser San Diego was very successful in promoting the interest of a diverse population of youth towards a career in medicine. Long-term follow-up of the participants' career choices is needed.**

The Bohensky Dissection Serieshas been used successfully by more than 300,000 biology students nationwide. Each book in the series is designed to guide the student through the study of anatomical structures. The books do this through the use of clearly marked photographs and illustrations. Accompanying text offers the student both easy-to-follow dissection instructions and factual information about the section under observation. At the end of each chapter there are tests which can be used for self-study or for grade course evaluation. Within the traditional dissection portion of a biology course, many programs include the sheep heart, eye, and brain. Within many of these guides, the author has incorporated photographs of these structures to more closely follow standard course curriculum. The author also provides important information on human organs such as the eye, ear, and heart. In this way, the student can better understand the role and function of these organs as they relate to human life processes. Add to this each book's large-size format, lay-flat spiral binding, and reasonable cost, and you can see why the Bohensky Dissection Series has become one of the most successful dissection guides used throughout this country's schools.

Brain Renaissance: From Vesalius to Modern Neuroscience is published on the 500th anniversary of the birth and the 450th anniversary of the death of Vesalius. The authors translated those Latin chapters of the Fabrica dedicated to the brain, a milestone in the history of neuroscience. Many chapters are accompanied by a commentary tracking the discoveries that paved the way to our modern understanding of the brain - from the pineal gland that regulates sleep, the fornix and mammillary bodies for memory, the colliculi for auditory and visual perception, and the cerebellum for motor control, to the corpus callosum for interhemispheric cross-talk, the neural correlates of senses, and the methods for dissections. The chapters constitute a primer for those interested in the brain and history of neuroscience. The translation, written with modern anatomical terminology in mind, provides direct access to Vesalius' original work on the brain. Those interested in reading the words of the Renaissance master will find the book an invaluable addition to their Vesalian collection. Brain Renaissance pays a tribute to the work of the pioneers of neuroscience and to the lives of those with brain disorders, through whose suffering most discoveries are made. It's an unforgettable journey inspired by the work of the great anatomist, whose words still resonate today.

This book examines the two chief anatomical and physiological embodiment theories of voluntary animal motion, which I call the cardioisener and cerebrouneomuscular theories of motion, from the time of Aristotle (384-322 B.C.) to that of Mondino (d. A.D. 1326). The study of animal motion commenced with the ancient Greek natural scientist Aristotle who wrote the monograph 'On the motion of animals' (De motu animalium). Subsequent inquiries into voluntary animal motion may be found in a variety of Greek, Latin, and Arabic compendia, commentaries, and encyclopedias throughout the ancient and medieval periods. The motion of animals was considered relevant to natural philosophers and theologians investigating the nature of the soul, and to physicians seeking to discover the causes of disorders of voluntary movement such as epilepsy and tetany. The book fills a gap in the scholarly literature concerned with pre-modern studies of the anatomical and physiological mechanisms of will and bodily movement. The accompanying photographs of my own anatomical dissections illuminate ancient and medieval conceptual, empirical, and experimental methods of anatomical and physiological research.
