With a focus on what mathematics and science educators need to know about academic language used in the STEM disciplines, this book critically synthesizes the current knowledge base on language challenges inherent to learning mathematics and science, with particular attention to the unique issues for English learners. These key questions are addressed: When and how do students develop mastery of the language registers unique to mathematics and to the sciences? How do teachers use assessment as evidence of student learning for both accountability and instructional purposes? Orienting each chapter with a research review and drawing out important Focus Points, chapter authors examine the obstacles to and latest ideas for improving STEM literacy, and discuss implications for future research and practice.

Chemical Reactions Science Learning Guide

In the context of life cycles, these units use central science concepts to explore the energy, raw materials, and waste issues that are the history of any manufactured product. As students consider the trade-offs made at each step, they will learn to recognize the decisions made to balance economic, developmental, and environmental needs.

With age-appropriate, inquiry-centered curriculum materials and sound teaching practices, middle school science can capture the interest and energy of adolescent students and expand their understanding of the world around them.

Resources for Teaching Middle School Science, developed by the National Science Resources Center (NSRC), is a valuable tool for identifying and selecting effective science curriculum materials that will engage students in grades 6 through 8. The volume describes more than 400 curriculum titles that are aligned with the National Science Education Standards. This completely new guide follows on the success of Resources for Teaching Elementary School Science, the first in the NSRC

series of annotated guides to hands-on, inquiry-centered curriculum materials and other resources for science teachers. The curriculum materials in the new guide are grouped in five chapters by scientific area-Physical Science, Life Science, Environmental Science, Earth and Space Science, and Multidisciplinary and Applied Science. They are also grouped by type-core materials, supplementary units, and science activity books. Each annotation of curriculum material includes a recommended grade level, a description of the activities involved and of what students can be expected to learn, a list of accompanying materials, a reading level, and ordering information. The curriculum materials included in this book were selected by panels of teachers and scientists using evaluation criteria developed for the guide. The criteria reflect and incorporate goals and principles of the National Science Education Standards. The annotations designate the specific content standards on which these curriculum pieces focus. In addition to the curriculum chapters, the guide contains six chapters of diverse resources that are directly relevant to

middle school science. Among these is a chapter on educational software and multimedia programs, chapters on books about science and teaching, directories and guides to science trade books, and periodicals for teachers and students. Another section features institutional resources. One chapter lists about 600 science centers, museums, and zoos where teachers can take middle school students for interactive science experiences. Another chapter describes nearly 140 professional associations and U.S. government agencies that offer resources and assistance. Authoritative, extensive, and thoroughly indexed-and the only guide of its kind-Resources for Teaching Middle School Science will be the most used book on the shelf for science teachers, school administrators, teacher trainers, science curriculum specialists, advocates of hands-on science teaching, and concerned parents.

Using Socioscientific Issues to Develop Scientific Literacy

For high school science teachers, homeschoolers, science coordinators, and informal science educators, this collection of 50 inquiry-based labs provides hands-on ways for students to learn science at homeOCosafely. Author Michael Horton promises that students who conduct the labs in Take-Home Chemistry as supplements to classroom instruction will enhance higher-level thinking,

improve process skills, and raise high-stakes test scores."

"Functional scientific literacy requires an understanding of the nature of science and the skills necessary to think both scientifically and ethically about everyday issues." —from the introduction to It's Debatable! This book encourages scientific literacy by showing you how to teach the understanding and thinking skills your students need to explore real-world questions like these:

- Should schools charge a "tax" to discourage kids from eating unhealthy foods?*
- Should local governments lower speed limits to reduce traffic fatalities?*
- Should pharmaceutical companies be allowed to advertise prescription drugs directly to consumers?*

At the core of the exploration is the Socioscientific Issues Framework. The framework gives students practice in the research, analysis, and argumentation necessary to grapple with difficult questions and build scientific literacy. After introducing the concept of the framework and explaining how it aligns with the Next Generation Science Standards, the book shows you how to implement it through seven units targeted to the elementary, middle, and high school levels. You even find out how to develop your own socioscientific issues curriculum. Both practical and content-rich, It's Debatable! doesn't shy away from controversy. Instead, the authors encourage you and your students to confront just how messy the

questions raised by science (and pseudoscience) can be. After all, as the authors note, "The only way for our students to be prepared for participation in societal discourse is to have practice in their school years, and what better place than the science classroom?"

The Chemical Reactions Student Learning Guide includes self-directed readings, easy-to-follow illustrated explanations, guiding questions, inquiry-based activities, a lab investigation, key vocabulary review and assessment review questions, along with a post-test. It covers the following standards-aligned concepts: Changes of Matter; Chemical Reactions; Formulas & Equations; Balancing Equations; Types of Chemical Reactions (1); Types of Chemical Reactions (2); Energy in Chemical Reactions; Evidence of Chemical Reactions; and Chemical Reaction Rates & Catalysts. Aligned to Next Generation Science Standards (NGSS) and other state standards.

Experiments and Exercises in Basic Chemistry

Gifted and talented students and any student interested in

pursuing a science major in college needs a rigorous program to prepare them while they are still in high school. This book utilizes a format where the application of several disciplines and science, math, and language arts principles and are mandated. Each lab concludes with either an essay or a detailed analysis of what happened and why it happened. This format is based on the expectations of joining a university program or becoming an industrial science professional. The ideal student lab report would be written in a lab research notebook, and then the essay or final analysis is done on a word processor to allow for repeat editing and corrections. The research notebook has all graph pages, a title section, and a place for the students and their assistants to sign and witness that exercise. The basic mechanics of the lab report and title, purpose, procedure, diagrams, data table, math and calculations, observations, and graphs are handwritten into the book. The conclusion is done on a word processor (MS Word), which allows the instructor to guide

the student in writing and editing a complete essay using the MLA format. When the final copy is completed, the essay is printed and inserted into the lab notebook for grading.

At the end of the term, the student has all their labs in one place for future reference. These lab notebooks can be obtained for as little as \$ 3.00 per book. This is money well-spent. In our district, the Board of Education buys the books for each student. the BOE sees these books as expendable but necessary materials for all science and engineering instruction.

The Value of Science Projects Science projects are an especially effective way of teaching students about the world around them. Whether conducted in the classroom or for a science fair, science projects can help develop critical thinking and problem solving skills. In a classroom setting, science projects offer a way for teachers to put "action" into the lessons. The students have fun while they're learning important knowledge and skills. And the teacher often learns with the students, experiencing excitement with

each new discovery. Science projects are generally of two types: non-experimental and experimental. Non-experimental projects usually reflect what the student has read or heard about in an area of science. By creating displays or collections of scientific information or demonstrating certain natural phenomena, the student goes through a process similar to a library research report or a meta-analysis in any other subject. Projects of this type may be appropriate for some students at a very early level, but they usually do not provide the experiences that develop problem-solving skills related to the scientific process. On the other hand, experimental projects pose a question, or hypothesis, which is then answered by doing an experiment or by modeling a phenomenon. The question doesn't have to be something never before answered by scientist—that is not necessary to conduct original research. The process of picking a topic, designing an experiment, and recording and analyzing data is what's important.
