costs. Written in a clear, engaging, jargon-free style, this volume offers a cutting-edge theoretical overview of the topic of genre as practiced in British, American and French film criticism. Organized by a series of simple but fundamental questions, the book uses numerous examples from classic Hollywood cinema (the western, drama, musical comedy, and film noir) as well as some more contemporary examples from European or Asian cinema that are so often neglected by other studies in the field. How do we characterize genre and what are its various functions? In what ways does genre give a film its

The book covers the functions most people will use, plus a number of specialized tasks that you may need for specific applications. It illustrates the various tasks you can perform, shows where to access them in the user interface, and shows how to get started with a particular task using basic or default settings.

In many applications of geophysics (weather forecast, study of climate evolution and variability), it is necessary to get the best

possible estimate of the state of the system under study. In general, information about this system comes from observations and numerical models. However, none of these sources is perfect. Data assimilation designates the set of mathematical methods used to optimally combine observations with models, to fulfil the need of an accurate estimate of the system state. Because of the weather forecast problem in particular, the geophysical sciences have shaped a long history and a strong background on data assimilation, particularly with big and

This book offers a comprehensive overview of nanocrystalline cellulose (NCC) and the development of advanced materials based on NCC for industrial and medical applications. The contents provide unique information on the physics, chemistry, biology and technology of NCC and NCC-based advanced materials, in addition to detailed coverage of the engineering aspects, addressing the challenges involved in

nanomanufacturing on a large industrial scale. Contents include: A detailed treatment of the structure, morphology and synthesis of NCC. The science and engineering of producing NCC and how surface/interface modifications of NCC could lead to developing novel biomaterials with attractive structural and functional properties. The scientific bases for developing NCC-based nanomaterials with advanced functionalities for industrial/medical applications. A detailed coverage of the eco-efficient engineering processes and technical modifications required for the potential manufacture of these functional bionanomaterials for applications such as packaging and utilization in heavy industries (e.g., automotives). This book is for audiences in the physical, chemical and biological sciences as well as engineering disciplines. It is of critical

behaviour of gases, simple solids and liquids, suspensions, polymers, emulsions, foams, and granular materials, along with techniques for measuring that behaviour. Besides molecular materials in all their classical gaseous, solid, or liquid states, we deal daily with a number of other materials made of coarser elements such as polymers, cells, grains, bubbles, and droplets. They take on the familiar appearance of paints, inks, cements, muds, foams, emulsions, toothpastes, gels, etc. These materials exhibit complex structures

and sometimes amazing types of mechanical behaviour, often intermediate between those of a simple liquid and a simple solid. From a practical standpoint, the aim is to analyze their internal evolution (aging, restructuring, phase separation, etc.), then to formulate these materials in accordance with the desired properties, and thereby devise new materials. With that aim in mind, it is crucial to understand how these materials deform or flow, depending on the interactions and structures formed by the elements they
